

Digital Camera Adapter:

Litetec's universal digital camera adapters work with nearly all digital cameras on the market. You can even attach a small camcorder to your portascope (with the LTDA-02)

Our universal camera adapters work by pressing the lens of the digital camera on the eyepiece of the portascope.

Depending on where the Tripod Thread is on the bottom of your camera, you need the LTDA-01 or LTDA-02.

We differentiate cameras where the optical axis is inline with the lens and where it is offset.

See below for images of a camera which is offset and one which is inline, you can see which model of adapter you will need to purchase by checking which picture resembles your camera.

Offset type: (Optical axis and lens not inline) USE THE LTDA-01

Inline Type: (Optical axis and lens inline) USE THE LTDA-02
